

BAT Bangladesh achieves zero unscheduled downtime, saving 5.2 million USD in production loss

CASE STUDY

FACILITY OVERVIEW

LOCATION

DHAKA, BANGLADESH

BUILT IN

2000s

Total Area

120,000 sqft

BUILDING CERTIFICATION LEVEL

GOLD

CONTROLLER TYPE

SIEMENS PLC

ASSET CONTROLLED

- Electric Motors
- Boilers
- Generators
- Production Machineries

CONTEXT

A Vast Industrial Complex in Southeast Asia

Situated in Bangladesh's Capital center, BAT Bangladesh's head office has been a great architectural construction. Faced with rising energy asset management costs such as unplanned downtime cost, the production operation team sought an innovative solution to comply with regulations, optimize energy asset management costs particularly the electric motors and utilities side assets. Client identified Enerzyz as the ideal solution.

PROCESS

Unified Management through Enerzyz OS

Enerzyz worked closely with the factory's controls contractor and internal team to integrate Enerzyz OS with the existing PLCs. This allowed the facility team to use their existing tool set and systems to observe the AI in use throughout their building.

Enerzyz OS was ingesting data through our universal control module, while communicating via OPC-UA, Modbus and MQTT for sensors. The roll-out was executed in the PMD Division, in close cooperation with the factory Project Manager, ensuring that the production remained unaffected and disruption-free throughout. This collaborative effort was key to the customer's positive experience and the project's long-term success.

The whole production floor consists of numerous electric motors to drive and move things throughout the factory. Any 1h unplanned downtime costs the factory almost 1 Million USD in lost revenue. Enerzyz Utilities Domain Adapted AI Engine was connected to all these electric motors as well as boilers and generators of the factory for indexing of the assets in realtime. This data was used to train the AI engine on the facility parameter and do necessary calibration. Within a week of the training, the Enerzyz OS provided significant insights to avoid a significant unplanned downtime. The Factory faced no unplanned downtime throughout the period of the deployment.

RESULTS

Results for all stakeholders

Over a 4-month period in 2026, BAT Bangladesh realized substantial cost savings by avoiding unplanned downtime. Our Optimization solution ensured zero unplanned downtime. Enerzyz AI reduced boiler fuel consumption by optimizing boiler efficiency curve and keeping it at peak efficiency. It also reduced fuel consumption cost and management cost of generators by ensuring AI driven awareness of the generator lifecycle.

With a firm focus on production performance and factory operations (two key priorities of the client), our team and autonomous AI solution delivered outstanding results. through collaboration and effective communication with the customer and their controls contractor, Enerzyz consistently provided value throughout the ongoing partnership. As a result, BAT Bangladesj not only realized significant savings, but also met regulatory demands and enhanced operational efficiency, driving value for the organizational goal. Point to note that, total manhour reduction in facility management has not been taken into account for this case study.
